📚 Unit-8 Case Study

Case Study 1: Data Science in Healthcare

This case study directly aligns with **Unit-8: Applying Domain Expertise to Solve Real-World Problems Using Data Science** from your syllabus

1. Introduction

Healthcare is one of the most critical domains where **data science is transforming decision-making, diagnosis, treatment, and patient care**. Traditionally, healthcare relied heavily on manual analysis, doctor experience, and limited datasets. However, modern healthcare generates massive amounts of data from:

- Electronic Health Records (EHR)
- Medical imaging (X-rays, MRI, CT scans)
- Wearable devices (heart rate, activity)
- Lab test reports
- Genomic data

Data science helps convert this raw data into **actionable insights**.

2. Problem Statement

Hospitals face multiple challenges:

Problem	Description
Late diagnosis	diseases detected at advanced stages
Human error	incorrect or delayed decisions
Data overload	too much data, hard to analyze
High cost	inefficient resource usage
Patient risk	critical patients not identified early

👉 Goal of Data Science:

- Predict diseases early
- Improve diagnosis accuracy
- Reduce healthcare cost
- Optimize hospital operations

3. Case Study Scenario

Problem: Predicting Heart Disease Risk

Heart disease is one of the leading causes of death. Early prediction can save lives.

Objective: Build a **machine learning model** that predicts whether a patient has heart disease based on medical data.

4. Data Collection

Data is collected from:

- Patient records
- Hospitals
- Diagnostic centers

Example Dataset Features:

Feature	Meaning

DhruvPatel16120

Age	patient age
Gender	male/female
Blood Pressure	BP level
Cholesterol	cholesterol level
Heart Rate	pulse rate
Chest Pain	symptom indicator
ECG results	heart activity
Diabetes	yes/no

👉 Target Variable:

Output	Meaning
1	Disease present
0	No disease

5. Data Preprocessing
Raw data is not usable directly

Steps:
5.1 Data Cleaning

- Remove missing values
- Handle incorrect entries

5.2 Data Transformation

- Convert categorical → numeric
- Normalize values

5.3 Feature Selection

- Select important variables
- Remove irrelevant features

6. Exploratory Data Analysis (EDA)
EDA helps understand

Examples:

- Age vs Disease probability
- Cholesterol vs risk
- BP vs severity

Insights:

Observation	Insight
High cholesterol	higher risk
Older age	higher probability
High BP	strong indicator

7. Model Building
Multiple models can be applied:

Model	Purpose
Logistic Regression	probability prediction
Decision Tree	rule-based classification

DhruvPatel16120

Random Forest	high accuracy model

☞ Example Model Used: **Random Forest**

8. Model Training

Steps:

1. Split data into:
    - Training (80%)
    - Testing (20%)
2. Train model on training data
3. Learn patterns

9. Model Evaluation

Use metrics:

Metric	Meaning
Accuracy	overall correctness
Precision	correct positives
Recall	detect disease cases
F1-score	balance

Example Result:

Metric	Value
Accuracy	88%
Precision	85%
Recall	90%

☞ High recall is important (avoid missing patients)

10. Prediction Process

New patient data:

Feature	Value
Age	55
BP	High
Cholesterol	High

☞ Model Output: P(Disease) = 0.82

☞ Decision: Disease detected → early treatment

11. Real-World Impact

Benefit	Explanation
Early diagnosis	saves lives
Reduced cost	preventive care
Faster decisions	automated systems
Better treatment	personalized care

12. Advanced Applications in Healthcare

12.1 Medical Imaging

- Detect tumors using AI

DhruvPatel16120

- Analyze X-rays automatically

12.2 Drug Discovery

- Predict effective medicines
- Reduce research time

12.3 Personalized Medicine

- Treatment based on patient data

12.4 Remote Monitoring

- Wearable devices track health
- Real-time alerts

13. Challenges in Healthcare Data Science

Challenge	Description
Data privacy	patient data sensitive
Data quality	missing/inconsistent data
Bias	unfair predictions
Interpretability	models must be explainable

14. Ethical Considerations

- Patient confidentiality
- Fair decision-making
- Avoid algorithm bias
- Transparency in models

15. Role of Domain Expertise

👉 Very important in healthcare

Role	Importance
Doctors	interpret results
Data scientists	build models
Engineers	implement systems

👉 Collaboration = success

17. Future Scope

- AI-based surgery
- Real-time diagnosis
- Smart hospitals
- Predictive healthcare systems

18. Conclusion

Data science is revolutionizing healthcare by transforming raw medical data into meaningful insights. It enables:

- early disease detection
- improved accuracy
- cost reduction
- better patient outcomes

This case study demonstrates how machine learning models like Random Forest can be applied to predict diseases and assist doctors in decision-making.

DhruvPatel16120

16. End-to-End Workflow

Problem Identification
↓
Data Collection
↓
Data Preprocessing
↓
EDA
↓
Model Building
↓
Evaluation
↓
Deployment
↓
Real-world usage

✔ **Final Understanding**
👉 Healthcare + Data Science = Life-saving combination
👉 It shifts healthcare from:
Reactive → Predictive → Preventive

Final One-line Conclusion:
Data science in healthcare enables early diagnosis, accurate predictions, and efficient decision-making by analyzing complex medical data to improve patient outcomes and system efficiency.

Case Study 2: Delving into Customer Personality Analysis

This case study aligns with **Unit-8: Applying Domain Expertise to Solve Real-World Problems Using Data Science** from your syllabus

1. Introduction
In modern business, companies do not just sell products—they build **relationships with customers**. Understanding customer personality, behavior, and preferences is essential for:

- Targeted marketing
- Customer retention
- Revenue growth

Traditional methods (surveys, assumptions) are limited. Data science enables **deep analysis of customer behavior using data-driven techniques**.

2. Problem Statement
Businesses face challenges such as:

Problem	Description
Low conversion rate	marketing campaigns fail
Poor targeting	wrong customers targeted
High churn	customers leave

DhruvPatel16120

Lack of personalization	same offers for all

☞ Goal of Data Science:

- Understand customer behavior
- Segment customers
- Predict buying patterns
- Personalize marketing strategies

3. Case Study Scenario

Problem: Customer Personality Analysis for Marketing Optimization

A retail company wants to:

- Identify different types of customers
- Understand their buying habits
- Improve marketing campaigns

Objective: Use data science to **analyse customer personality and segment them into meaningful groups**.

4. Data Collection

Data collected from:

- Purchase history
- Website activity
- Customer profiles
- Marketing responses

Example Dataset Features:

Feature	Meaning
Age	customer age
Income	annual income
Education	qualification
Marital Status	single/married
Spending Score	purchasing behavior
Purchase Frequency	how often buys
Product Categories	type of products
Campaign Response	accepted/rejected

☞ Target:

- No fixed label → unsupervised learning used

5. Data Preprocessing

5.1 Data Cleaning

- Remove missing values
- Fix inconsistent entries

5.2 Data Transformation

- Encode categorical variables
- Normalize numeric data

DimplePatel16120

5.3 Feature Engineering

- Create new features
  - Total spending
  - Average purchase value

6. Exploratory Data Analysis (EDA)

EDA helps identify patterns:

Key Analysis:

- Age vs Spending
- Income vs Purchase behavior
- Campaign response vs category

Insights:

Observation	Insight
High income + high spending	premium customers
Young age	more online activity
Frequent buyers	loyal customers

7. Customer Segmentation (Core Step)

Technique Used:

☞ Clustering (K-Means Algorithm)

Idea:

Group customers into clusters based on similarity

Output Example:

Cluster	Description
Cluster 1	High-income, high spenders
Cluster 2	Low-income, low spenders
Cluster 3	Young frequent buyers
Cluster 4	Occasional buyers

8. Model Building

K-Means Steps:

1. Choose number of clusters (K)
2. Assign data points
3. Calculate centroids
4. Update clusters
5. Repeat until stable

9. Evaluation of Clustering

Metric	Meaning
Elbow Method	optimal K selection
Silhouette Score	cluster quality

10. Customer Personality Types

After clustering:

DhruvPatel16120

Example Personas:

1. Premium Customers

- High income
- High spending
- Loyal

2. Budget Customers

- Low income
- Price-sensitive

3. Impulsive Buyers

- Frequent purchases
- Respond to offers

4. Occasional Buyers

- Rare purchases
- Low engagement

11. Business Insights

Insight	Action
Premium customers	offer luxury products
Budget customers	give discounts
Impulsive buyers	flash sales
Occasional buyers	engagement campaigns

12. Marketing Strategy Optimization

Personalized Marketing

Segment	Strategy
High spenders	premium offers
Young customers	social media ads
Frequent buyers	loyalty programs

Campaign Targeting

- Send emails only to relevant customers
- Reduce marketing cost

13. Predictive Analysis

Using classification models:

- Predict if customer will respond to campaign
- Predict churn

14. Tools and Techniques Used

Category	Tools
Data Analysis	Python, Pandas
Visualization	Matplotlib, Seaborn
ML Models	K-Means, Decision Tree
Deployment	Dashboard tools

DhruvPatel16120

15. Challenges

Challenge	Description
Data quality	incomplete data
Changing behavior	dynamic patterns
Privacy issues	customer data protection
Feature selection	choosing right variables

16. Ethical Considerations

- Protect customer privacy
- Avoid misuse of personal data
- Ensure transparency

17. Real-World Impact

Benefit	Explanation
Increased sales	targeted marketing
Customer satisfaction	personalized experience
Reduced cost	efficient campaigns
Better decision-making	data-driven

18. End-to-End Workflow

Business Problem
↓
Data Collection
↓
Data Cleaning
↓
EDA
↓
Clustering
↓
Customer Segmentation
↓
Strategy Implementation
↓
Business Growth

19. Future Scope

- AI-driven personalization
- Real-time recommendation systems
- Behavior prediction models
- Automated marketing systems

20. Conclusion

Customer personality analysis using data science allows businesses to move from **mass marketing to personalized marketing**. By understanding customer segments, companies can:

- improve engagement
- increase revenue
- enhance customer satisfaction

DhruvPatel16120

This case study demonstrates how clustering techniques like K-Means help identify meaningful customer groups and optimize business strategies.

✔ **Final Understanding**

☞ Data science helps businesses answer:

- Who are my customers?
- What do they want?
- How should I target them?

Final One-line Conclusion:

Customer personality analysis uses data science techniques like clustering to segment customers and enable personalized marketing strategies that improve engagement, satisfaction, and business growth.

Case Study 3: Data Science for Driving Growth in E-Commerce

This case study aligns with **Unit-8: Applying Domain Expertise to Solve Real-World Problems Using Data Science** from your syllabus

1. Introduction

E-commerce platforms (Amazon, Flipkart, etc.) operate in a **highly competitive digital environment** where success depends on:

- Customer experience
- Personalization
- Efficient operations
- Smart pricing

Every click, search, purchase, and interaction generates data. Data science transforms this raw data into **strategic decisions that drive growth**.

2. Problem Statement

E-commerce companies face multiple challenges:

Problem	Description
Low conversion rate	users visit but don't buy
Cart abandonment	users leave without purchase
Poor recommendations	irrelevant suggestions
Inventory issues	overstock or stockouts
Price competition	difficulty setting optimal price

☞ Goal of Data Science:

- Increase sales and revenue
- Improve customer experience
- Optimize pricing and inventory
- Reduce churn

3. Case Study Scenario

Problem: Improving Sales and Customer Retention

An e-commerce company wants to:

- Increase conversion rate
- Improve recommendation system

DhruvPatel16120

- Reduce cart abandonment

Objective: Use data science techniques to **analyze customer behavior and optimize business operations**

4. Data Collection
Data sources include:
- Website logs (clicks, views)
- Transaction data
- Customer profiles
- Product details
- Reviews and ratings

Example Dataset Features:

Feature	Meaning
User ID	customer identity
Product ID	item viewed
Time spent	browsing time
Click history	pages visited
Purchase history	past transactions
Cart data	items added/removed
Ratings	product feedback

5. Data Preprocessing

5.1 Data Cleaning
- Remove duplicates
- Handle missing values

5.2 Data Transformation
- Encode categorical variables
- Normalize numeric values

5.3 Feature Engineering
Create new features:

Feature	Meaning
Total spending	customer value
Frequency	repeat purchases
Recency	last purchase time

6. Exploratory Data Analysis (EDA)
EDA helps identify trends:

Analysis Examples:
- Most viewed products
- Peak shopping time
- Customer segments

Insights:

Observation	Insight
High cart abandonment	checkout issues

DhruvPatel16120

Frequent buyers	loyal customers
High bounce rate	poor UI/UX

7. Key Data Science Applications

7.1 Recommendation System (Core)

Purpose: Suggest relevant products

Techniques:

Method	Description
Collaborative Filtering	based on similar users
Content-Based Filtering	based on product features

👉 Example: User buys phone → system recommends accessories

7.2 Customer Segmentation

Use clustering:

Segment	Description
High-value customers	frequent buyers
New customers	first-time users
At-risk customers	inactive users

7.3 Churn Prediction

Goal: Predict which customers may leave

Model:

- Logistic Regression
- Decision Tree

7.4 Demand Forecasting

Purpose: Predict future sales

Techniques:

- Time series analysis
- Regression models

7.5 Dynamic Pricing

Idea: Adjust price based on:

- demand
- competition
- time

8. Model Building

Example models:

Task	Model
Recommendation	Matrix Factorization
Churn Prediction	Logistic Regression
Demand Forecast	ARIMA / Regression
Classification	Random Forest

DhruvPatel16120

9. Model Evaluation

Metric	Use
Accuracy	classification
Precision/Recall	churn detection
RMSE	forecasting
AUC-ROC	model quality

10. Example Workflow

User visits website
↓
Browse products
↓
Recommendation system suggests items
↓
User adds to cart
↓
Prediction model evaluates purchase probability
↓
Offer discount if needed
↓
Purchase completed

11. Business Impact

Area	Improvement
Sales	increased conversions
Marketing	targeted campaigns
Inventory	optimized stock
Customer experience	personalization

12. Real-World Example

Amazon Recommendation System

- Suggests products based on:
  - past purchases
  - similar users
  - browsing history

☞ Result:

- Higher sales
- Better engagement

13. Challenges

Challenge	Description
Data volume	massive data
Real-time processing	fast decisions needed
Cold start problem	new users/products
Data privacy	user protection

14. Ethical Considerations

Dhruvpatel16120

- User data protection
- Transparent recommendations
- Avoid manipulation

15. Tools and Technologies

Category	Tools
Data Processing	Python, Pandas
ML Models	Scikit-learn
Big Data	Hadoop, Spark
Visualization	Power BI, Tableau

16. End-to-End Workflow

Business Problem
↓
Data Collection
↓
Data Cleaning
↓
EDA
↓
Model Building
↓
Evaluation
↓
Deployment
↓
Continuous Improvement

17. Future Scope

- AI-powered chatbots
- Real-time recommendation systems
- Voice-based shopping
- Predictive personalization

18. Conclusion

Data science is a key driver of growth in e-commerce by enabling:

- personalized recommendations
- efficient operations
- predictive analytics

It helps companies understand customer behavior and make data-driven decisions to maximize revenue.

✔ **Final Understanding**

☞ E-commerce growth depends on:

- understanding users
- predicting behavior
- optimizing decisions

DhruvPatel16120

Final One-line Conclusion:
Data science drives e-commerce growth by leveraging customer data to enable personalized recommendations, predictive analytics, and optimized business strategies that enhance user experience and increase revenue.

Case Study 4: Data Science in Sentiment Analysis

This case study aligns with **Unit-8: Applying Domain Expertise to Solve Real-World Problems Using Data Science** from your syllabus

1. Introduction
In the digital world, people continuously express opinions through:

- Social media (Twitter, Instagram)
- Product reviews (Amazon, Flipkart)
- Blogs and forums

These opinions contain valuable insights about:

- Customer satisfaction
- Brand perception
- Product quality

Data science enables automatic analysis of this textual data using **Sentiment Analysis**, which determines whether a text is **positive, negative, or neutral**.

2. What is Sentiment Analysis
Definition: Sentiment Analysis is a technique in **Natural Language Processing (NLP)** used to identify and extract emotions or opinions from text data.

Output Types:

Sentiment	Meaning
Positive	good opinion
Negative	bad opinion
Neutral	no clear emotion

3. Problem Statement
Companies face challenges such as:

Problem	Description
Large volume of text	hard to analyze manually
Hidden opinions	difficult to extract insights
Delayed feedback	slow response to customers
Brand monitoring	hard to track reputation

☞ Goal of Data Science:

- Automatically analyze customer opinions
- Understand public sentiment
- Improve products and services

4. Case Study Scenario
Problem: Product Review Analysis
An e-commerce company wants to:

- Analyze thousands of customer reviews

DhruvPatel16120

- Identify customer satisfaction
- Improve product quality

Objective: Use sentiment analysis to **classify reviews into positive, negative, or neutral**

5. Data Collection
Data sources:
- Product reviews
- Social media posts
- Customer feedback

Example Dataset:

Review	Sentiment
"Great product!"	Positive
"Very bad quality"	Negative
"It's okay"	Neutral

6. Data Preprocessing (Very Important)
Text data must be cleaned

Steps:
6.1 Tokenization
Split sentence into words

6.2 Remove Stop Words
Remove common words (the, is, etc.)

6.3 Stemming / Lemmatization
Convert words to root form

6.4 Lowercasing
Standardize text

7. Feature Extraction
Convert text → numerical format

Methods:

Method	Description
Bag of Words (BoW)	word frequency
TF-IDF	importance of words
Word Embeddings	semantic meaning

8. Model Building
Algorithms Used:

Model	Use
Naïve Bayes	fast and simple
Logistic Regression	probability-based
Decision Tree	rule-based
Deep Learning (LSTM)	advanced NLP

9. Working of Sentiment Analysis

DhruvPatel16120

Text Input
↓
Preprocessing
↓
Feature Extraction
↓
Model Prediction
↓
Sentiment Output

10. Example (Step-by-Step)
Input: “I love this product, it is amazing!”

Process:
- Remove stop words
- Extract keywords: love, amazing

Prediction: ☞ Positive sentiment

11. Model Evaluation

Metric	Meaning
Accuracy	correct predictions
Precision	correct positives
Recall	detect all sentiments
F1-score	balance

12. Business Applications

12.1 Product Improvement
- Identify complaints
- Fix issues

12.2 Brand Monitoring
- Track public opinion
- Manage reputation

12.3 Customer Support
- Detect negative feedback quickly

12.4 Market Analysis
- Understand trends

13. Real-World Example
Twitter Sentiment Analysis
- Analyze tweets about a brand
- Detect public opinion

☞ Example:
- Launch of new product
- Measure customer reaction

14. Challenges

DhruvPatel16120

Challenge	Description
Sarcasm	difficult to detect
Context understanding	complex language
Multilingual data	multiple languages
Noise in text	irrelevant data

15. Ethical Considerations

- Respect user privacy
- Avoid misuse of data
- Ensure fairness

16. Tools and Technologies

Category	Tools
NLP Libraries	NLTK, SpaCy
ML Models	Scikit-learn
Deep Learning	TensorFlow, PyTorch
Visualization	Tableau

17. End-to-End Workflow

Collect Text Data
↓
Preprocess Data
↓
Extract Features
↓
Train Model
↓
Predict Sentiment
↓
Analyze Results

18. Future Scope

- AI chatbots
- Voice sentiment analysis
- Real-time analytics
- Emotion detection

19. Conclusion

Sentiment analysis is a powerful data science application that helps organizations understand customer opinions at scale. It enables:

- faster decision-making
- improved products
- better customer experience

✔ Final Understanding

👉 Sentiment analysis transforms:

DhruvPatel16120

Text → Insight → Action

👉 It helps answer:

- What do customers feel?
- Are they satisfied?

Final One-line Conclusion:

Sentiment analysis uses data science and NLP techniques to automatically classify text into emotional categories, enabling organizations to understand public opinion and improve decision-making.

DhruvPatel16120
